1 Inequalities

1.1 Introduction

Markov's Inequality

For a non-negative random variable X with expectation $E(X) = \mu$, and any $\alpha > 0$:

$$\mathbb{P}[X \geq \alpha] \leq \frac{\mathbb{E}(X)}{\alpha}$$

Chebyshev's Inequality

For a random variable X with expectation $E(X) = \mu$, and any $\alpha > 0$:

$$P[|X - \mu| \ge \alpha] \le \frac{\operatorname{Var}(X)}{\alpha^2}$$

1.2 Questions

1. Use Markov's to prove Chebyshev's Inequality:

- 2. Let X be the sum of 20 i.i.d. Poisson random variables X_1, \ldots, X_{20} with $E(X_i) = 1$. Find an upper bound of $P[X \ge 26]$ using,
 - (a) Markov's inequality:

(b) Chebyshev's inequality:

3. Bound It

A random variable X is always strictly larger than -100. You know that E(X) = -60. Give the best upper bound you can on $P[X \ge -20]$.

4. The citizens of the country USD (the United States of Drumpf) vote in the following manner for their presidential election: if the country is liberal, then each citizen votes for a liberal candidate with probability p and a conservative candidate with probability 1-p, while if the country is conservative, then each citizen votes for a conservative candidate with probability p and a liberal candidate with probability p. After the

election, the country is declared to be of the party with the majority of the votes.

- (a) Assume that $p = \frac{3}{4}$ and suppose that 100 citizens of USD vote in the election and that USD is known to be conservative. Provide a tight bound on the probability that it is declared to be a Liberal country.
- (b) Now let p be unknown; we wish to estimate it. Using the CLT, determine the number of voters necessary to determine p within an error of 0.01, with probability at least 0.95.

5. Squirrel Standard Deviation

As we all know, Berkeley squirrels are extremely fat and cute. The average squirrel is 40% body fat. The standard deviation of body fat is 5%. Provide an upper bound on the probability that a randomly trapped squirrel is either too skinny or too fat? A skinny squirrel has less than 27.5% body fat, and a fat squirrel has more than 52.5% body fat?

6. Consider a random variable Y with expectation μ whose maximum value is $\frac{3\mu}{2}$, prove that the probability that Y is 0 is at most $\frac{1}{3}$.

1.3 Covariance

1.4 Introduction

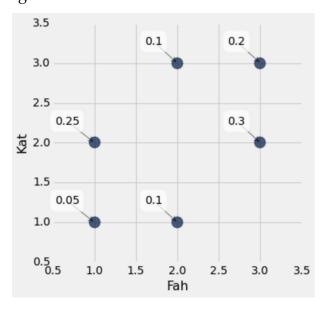

The **covariance** of two random variables *X* and *Y* is defined as:

$$Cov(X, Y) := E((X - E(X)) \cdot (Y - E(Y)))$$

1.5 Questions

1. Prove that Cov(X, X) = Var(X):

2. Consider the following distribution with random variables Fah and Kat:

Find the covariance of Fah and Kat.

3. Prove that if X and Y are independent, then Cov(X,Y)=0:

4. Roll 2 dice. Let A be the number of 6's you get, and B be the number of 5's, find Cov(A, B)

5. Prove that Cov(X + Y, Z) = Cov(X, Z) + Cov(Y, Z):

2 Linear Least Squares Estimator

Theorem: Consider two random variables, X, Y with a given distribution P[X=x,Y=y]. Then

$$L[Y|X] = E(Y) + \frac{Cov(X,Y)}{Var(X)}(X - E(X))$$

2.1 Questions

1. Assume that

$$Y = \alpha X + Z$$

where X and Z are independent and $\mathrm{E}(X)=\mathrm{E}(Z)=0.$ Find $\mathrm{L}[X|Y].$

- 2. The figure below shows the six equally likely values of the random pair (X, Y). Specify the functions of:
 - $\bullet \ L[Y\mid X]$
 - $E(X \mid Y)$
 - *L*[*X* | *Y*]
 - $E(Y \mid X)$
